

IMPORTANT INSTALL NOTICE

CORRECT PANEL ORIENTATION

The orientation of panels is important as there are fiber directions that effect light refraction and shading that makes the panels look different. **A**

Due to the manufacturing process, fiber directions may slightly vary making it important to install all panels in the orientation recommended on the manufacture's label on the backside of each panel.

If panels are not installed as recommended, they may have a different look even though the color is correct. This is because the fibers are directional. If the panels are not installed correctly, the hue will look different as seen on image **A** and correctly on panels in image **B**.

We suggest that you mock up the install prior to final mounting to make sure the panels all look consistent. Once you are confident in the consistency you can continue with the final installation.
